

## Single Phase, Isolated, Power Monitoring IC with Voltage Zero Crossing and Overcurrent Detection

### FEATURES AND BENEFITS

- Accurate power monitoring for both AC and DC applications
- UL certification for reinforced isolation up to 517 V<sub>RMS</sub> in a single package
- Accurate measurements of active, reactive, and apparent power, as well as power factor
- Separate RMS and instantaneous measurements for both voltage and current channels
- 0.85 mΩ primary conductor resistance for low power loss and high inrush current withstand capability
- Dedicated voltage zero crossing pin
- Overcurrent fault output pin
- Hall-effect-based current measurement with common-mode stray field rejection
- User-programmable undervoltage and overvoltage thresholds for input voltage as well as overcurrent fault thresholds
- 1 kHz bandwidth
- Current-sensing range from 0 to 90 A
- Options for I<sup>2</sup>C or SPI digital interface protocols
- User-programmable EEPROM and integrated charge pump
- 16-bit voltage and current ADCs

### PACKAGE

16-pin SOICW (suffix MA)

Not to scale

### DESCRIPTION

The Allegro ACS71020 power monitoring IC greatly simplifies the addition of power monitoring to many AC or DC powered systems. The sensor may be powered from the same supply as the system's MCU, eliminating the need for multiple power supplies and expensive digital isolation ICs. The device's construction includes a copper conduction path that generates a magnetic field proportional to applied current. The magnetic field is sensed differentially to reject errors introduced by common mode fields.

Allegro's Hall-effect-based galvanically isolated current sensing technology achieves reinforced isolation ratings in a small PCB footprint. These features enable isolated current sensing without expensive Rogowski coils, oversized current transformers, isolated operational amplifiers, or the power loss of shunt resistors.

The ACS71020 power monitoring IC offers key power measurement parameters that can easily be accessed through its SPI or I<sup>2</sup>C digital protocol interfaces. Dedicated and configurable I/O pins for voltage zero crossing, undervoltage and overvoltage reporting, and overcurrent fault detection are also available (in I<sup>2</sup>C mode). The thresholds for overvoltage, undervoltage, and overcurrent are all user-programmable via EEPROM.

The ACS71020 is provided in a small low-profile surface mount SOIC16 wide-body package, is lead (Pb) free, and is fully calibrated prior to shipment from the Allegro factory. Customer calibration can further increase accuracy in application.

  
CB Certificate Number:  
US-32210-M1-UL

### SELECTION GUIDE

Part Number	V <sub>CC(NOM)</sub> (V)	I <sub>PR</sub> (A)	Communication Protocol	T <sub>A</sub> (°C)	Packing <sup>[1]</sup>
ACS71020KMABTR-015B5-SPI	5	±15	SPI	−40 to 125	Tape and reel, 1000 pieces per reel, 3000 pieces per box
ACS71020KMABTR-030B3-SPI	3.3	±30			
ACS71020KMABTR-030B3-I2C	3.3	±30	I <sup>2</sup> C		
ACS71020KMABTR-090B3-I2C	3.3	±90			

<sup>[1]</sup> Contact Allegro for additional packing options.

### ABSOLUTE MAXIMUM RATINGS

Characteristic	Symbol	Notes	Rating	Units
Supply Voltage	$V_{CC}$		6.5	V
Reverse Supply Voltage	$V_{RCC}$		-0.5	V
Input Voltage	$V_{INP}$ , $V_{INN}$		$V_{CC} + 0.5$	V
Reverse Input Voltage	$V_{RNP}$ , $V_{RNN}$		-0.5	V
Digital I/O Voltage	$V_{DIO}$	SPI, I <sup>2</sup> C, and general purpose I/O	6	V
Reverse Digital I/O Voltage	$V_{RDIO}$		-0.5	V
Operating Ambient Temperature	$T_A$	Range K	-40 to 125	°C
Junction Temperature	$T_J(\text{max})$		165	°C
Storage Temperature	$T_{stg}$		-65 to 170	°C

### ISOLATION CHARACTERISTICS

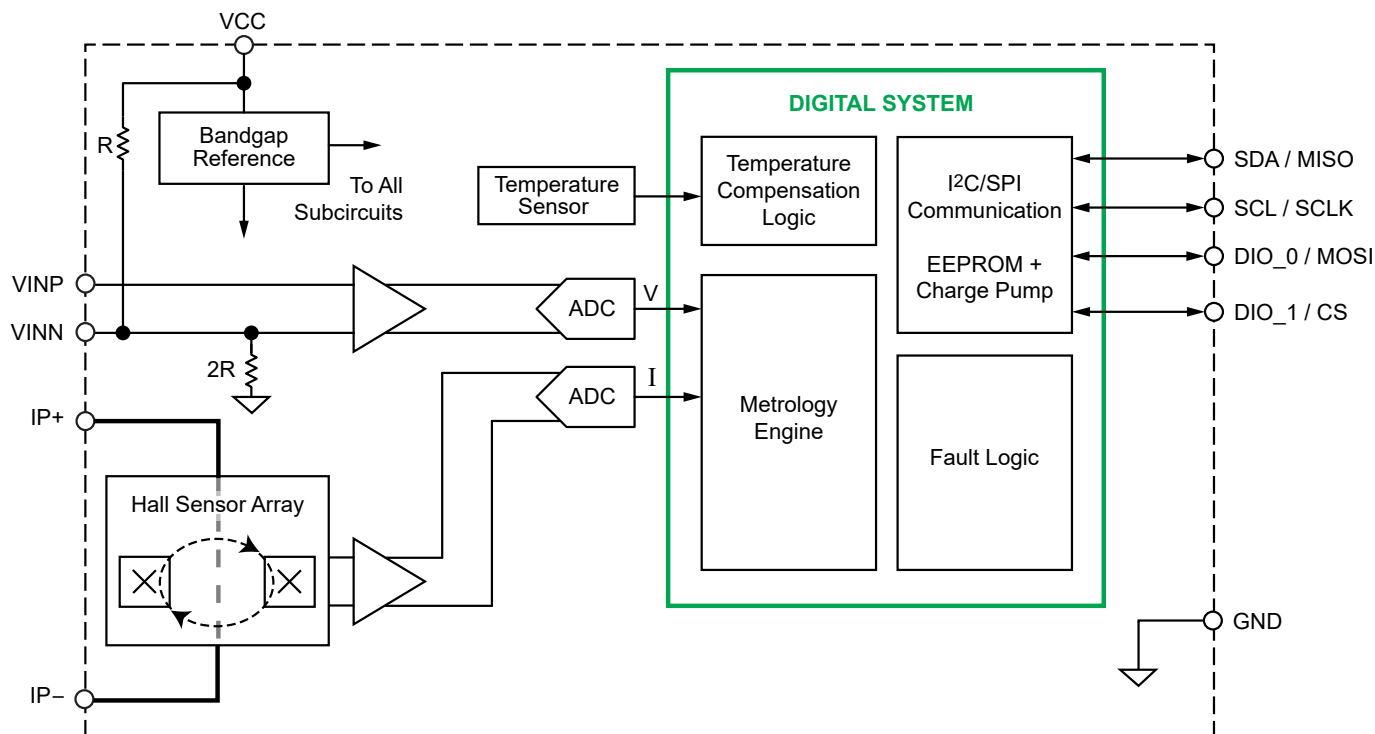

Characteristic	Symbol	Notes	Rating	Unit
Dielectric Strength Test Voltage	$V_{ISO}$	Agency type-tested for 60 seconds per UL 60950-1 (edition 2). Production tested at 3000 $V_{RMS}$ for 1 second, in accordance with UL 60950-1 (edition 2).	4800	$V_{RMS}$
Working Voltage for Basic Isolation	$V_{WVBI}$	Maximum approved working voltage for basic (single) isolation according to UL 60950-1 (edition 2).	1480	$V_{PK}$
			1047	$V_{RMS}$ or $V_{DC}$
Working Voltage for Reinforced Isolation	$V_{WVRI}$	Maximum approved working voltage for reinforced isolation according to UL 60950-1 (edition 2).	730	$V_{PK}$
			517	$V_{RMS}$ or $V_{DC}$
Clearance	$D_{cl}$	Minimum distance through air from IP leads to signal leads.	7.5	mm
Creepage	$D_{cr}$	Minimum distance along package body from IP leads to signal leads	7.5	mm

### THERMAL CHARACTERISTICS

Characteristic	Symbol	Test Conditions*	Value	Units
Package Thermal Resistance (Junction to Ambient)	$R_{\theta JA}$	Mounted on the Allegro 85-0738 evaluation board with 700 mm <sup>2</sup> of 4 oz. copper on each side, connected to pins 1 and 2, and to pins 3 and 4, with thermal vias connecting the layers. Performance values include the power consumed by the PCB.	23	°C/W
Package Thermal Resistance (Junction to Lead)	$R_{\theta JL}$	Mounted on the Allegro ACS71020 evaluation board.	5	°C/W

\*Additional thermal information available on the Allegro website. See <https://www.allegromicro.com/en/Design-Center/Technical-Documents/Hall-Effect-Sensor-IC-Publications/DC-and-Transient-Current-Capability-Fuse-Characteristics.aspx>.

### PINOUT DIAGRAM AND TERMINAL LIST

Pinout Diagram

Terminal List Table

Number	Name	Description	
		I2C	SPI
1, 2, 3, 4	IP+	Terminals for current being sensed; fused internally	
5, 6, 7, 8	IP-	Terminals for current being sensed; fused internally	
9	DIO_1/CS	Digital I/O 1	Chip Select (CS)
10	DIO_0/MOSI	Digital I/O 0	MOSI
11	SCL/SCLK	SCL	SCLK
12	SDA/MISO	SDA	MISO
13	VCC	Device power supply terminal	
14	GND	Device Power and Signal ground terminal	
15	VINN	Negative Input Voltage	
16	VINP	Positive Input Voltage	

### DIGITAL I/O

The Digital I/O can be programmed to represent the following functions (Digital Output pins are low true):

DIO\_0:

0. VZC: Voltage zero crossing
1. OVRMS: The VRMS overvoltage flag
2. UVRMS: The VRMS undervoltage flag
3. The OR of OVRMS and UVRMS (if either flag is triggered, the DIO\_0 pin will be asserted)

DIO\_1:

0. OCF: Overcurrent fault
1. UVRMS: The VRMS undervoltage flag
2. OVRMS: The VRMS overvoltage flag
3. The OR of OVRMS, UVRMS, and OCF\_LAT [Latched Overcurrent fault] (if any of the three flags are triggered, the DIO\_1 pin will be asserted)

**COMMON ELECTRICAL CHARACTERISTICS** [1]: Valid through the full range of  $T_A$  and  $V_{CC} = V_{CC(nom)}$ , unless otherwise specified

Characteristic	Symbol	Test Conditions	Min.	Typ.	Max.	Unit
<b>ELECTRICAL CHARACTERISTICS</b>						
Supply Voltage	$V_{CC}$		$V_{CC(nom)} \times 0.9$	$V_{CC(nom)}$	$V_{CC(nom)} \times 1.1$	V
Supply Current	$I_{CC}$	$V_{CC(min)} \leq V_{CC} \leq V_{CC(max)}$ , no load on output pins	–	12	14	mA
<b>VOLTAGE INPUT BUFFER</b>						
Differential Input Range	$\Delta V_{IN}$	$V_{INP} - V_{INN}$	–275	–	275	mV
Common Mode Input Voltage	$V_{IN(CM)}$		$\frac{2}{3} \times V_{CC} - 0.275$	–	$\frac{2}{3} \times V_{CC} + 0.275$	V
<b>VOLTAGE CHANNEL ADC</b>						
Sample Frequency	$f_S$		–	32	–	kHz
Number of Bits	$N_{ADC(V)}$		–	16	–	bits
Voltage ADC Power Supply Rejection	$V\_PSRR$	Ratio of change on $V_{CC}$ to change in ADC internal reference at DC	60	70	–	dB
<b>VOLTAGE CHANNEL</b>						
Noise	$V_N$		–	10	–	LSB
Internal Bandwidth	BW		–	1	–	kHz
Linearity Error	$E_{LIN}$		–	$\pm 0.2$	–	%
<b>CURRENT CHANNEL ADC</b>						
Sample Frequency	$f_S$		–	32	–	kHz
Number of Bits	$N_{ADC(I)}$		–	16	–	bits
Current Channel ADC Power Supply Rejection	$I\_PSRR$	Ratio of change on $V_{CC}$ to change in ADC internal reference at DC	60	70	–	dB
<b>CURRENT CHANNEL</b>						
Internal Bandwidth	BW		–	1	–	kHz
Primary Conductor Resistance	$R_{IP}$	$T_A = 25^\circ\text{C}$	–	0.85	–	m $\Omega$
Noise	$V_N$		–	100	–	LSB
Linearity Error	$E_{LIN}$		–	$\pm 1.5$	–	%
<b>OVERCURRENT FAULT CHARACTERISTICS</b>						
Fault Response Time	$t_{RF}$	Time from $I_P$ rising above $I_{FAULT}$ until $V_{FAULT} < V_{FAULT(max)}$ for a current step from 0 to $1.2 \times I_{FAULT}$ ; 10 k $\Omega$ and 100 pF from DIO_1 to ground; ftdly = 0	–	5	–	$\mu\text{s}$
Internal Bandwidth	BW		–	200	–	kHz
Fault Hysteresis [2]	$I_{HYST}$		–	$0.05 \times I_{PR}$	–	A
Fault Range	$I_{FAULT}$	Set using FAULT field in EEPROM	$0.5 \times I_{PR}$	–	$1.75 \times I_{PR}$	A
<b>VOLTAGE ZERO CROSSING</b>						
Voltage Zero Crossing Delay	$t_d$		–	700		$\mu\text{s}$

[1] Device may be operated at higher primary current levels,  $I_P$ , ambient,  $T_A$ , and internal leadframe temperatures,  $T_A$ , provided that the Maximum Junction Temperature,  $T_J(max)$ , is not exceeded.

[2] After  $I_P$  goes above  $I_{FAULT}$ , tripping the internal fault comparator,  $I_P$  must go below  $I_{FAULT} - I_{HYST}$ , before the internal fault comparator will reset.

[1] Typical values are based on mean  $\pm 3$  sigma.

## DATA ACQUISITION

### ADCs

Both the Current and Voltage channels are sampled at a high frequency and then digitally filtered and decimated to avoid large anti-aliasing filters. The final sample rate will be near 32 kHz for an 8 MHz clock. The digital low-pass filters are EEPROM programmable and have a cutoff from 1 to 8 kHz. The digital word from the ADC is 16 bits for both the current and the voltage.

### Raw Signal Sensitivity and Offset Trim

The gain and offset for both current and voltage channels use a shared temperature compensation engine which is trimmed in production. The fine sensitivity and offset are also trimmed in production at the factory; however, the user has access to the fine sensitivity field for the current channel should they want to trim the gain in application.

### Phase Compensation

Phase delay may be introduced on either the voltage or current channels. The range is EEPROM selectable, either 5° of delay (step size of 0.67°) or 40° of delay (step size of 5.36°).

### Zero Crossing

The zero crossings are only detected on the voltage signal. Both the high-to-low and low-to-high transitions will be detected with time-based hysteresis that removes the possibility of noise causing multiple zero crossings to be reported at each true zero crossing.

The zero crossing output can be a square wave that transitions at each zero crossing or a pulse with a fixed width at each zero crossing. When in pulse mode, the width of the pulse is  $t_p$  (see `delaycnt_sel`; nominal setting is 32  $\mu$ s). There will be a fixed delay,  $t_D$ , from the time that a true zero crossing has occurred to the time that it is reported. This delay helps to keep the zero crossing detection more precise.

Figure 4: Zero Crossing

## POWER CALCULATIONS

### $I_{RMS}$ / $V_{RMS}$

Cycle by cycle calculation of the root mean square of both the current and voltage channels:

$$I_{RMS} = \sqrt{\frac{\sum_{n=0}^{N-1} I_n^2}{N}} \quad V_{RMS} = \sqrt{\frac{\sum_{n=0}^{N-1} V_n^2}{N}}$$

where  $I_n$  (Icodes) and  $V_n$  (Vcodes) are the instantaneous measurements of current and voltage, respectively.

### Apparent Power

The magnitude of the complex power being measured; calculated at the end of each cycle:

$$|S| = I_{RMS} \times V_{RMS}$$

### Active Power

The real component of power being measured; calculated cycle by cycle:

$$P_{ACTIVE} = \frac{\sum_{n=0}^{N-1} P_n}{N} \quad P_n = I_n \times V_n$$

### Reactive Power

Imaginary component of power being measured; calculated at the end of each cycle:

$$Q = \sqrt{S^2 - P_{ACTIVE}^2}$$

### Power Factor

The magnitude of the ratio of real power to apparent power; calculated at the end of each cycle:

$$|PF| = \frac{P_{ACTIVE}}{|S|}$$

### Lead/Lag

The voltage leading or lagging the current will be communicated as a single bit. This bit also represents the sign of the Reactive Power.

Figure 5: Power Triangle

### Overcurrent Fault

The overcurrent fault threshold may be set from 50% to 175% of  $I_P$ . The user sets the trip point with an 8-bit word. The user also has the ability to set the trip level digital delay. This allows for up to a 32  $\mu$ s delay on the Fault.

### Averaging Over Time

IRMS or VRMS and PACTIVE may be averaged over a programmable number of updates. Note that either VMRS and IRMS can be averaged, not both.

The number of averages is controlled by two different registers. There is an accumulator that averages the above values. A 7-bit

number, rms\_avg\_1, is used to determine the number of averages. There is an additional accumulator that will be used to average the output of the first accumulator. There is a 10-bit number, rms\_avg\_2, that will be used to determine the number of averages for this accumulator. The combination of the two accumulator allows the user to select how long to average for as well as how often the values are updated. The exact time this averages over depends on n (the number of samples per cycle). Averages could be read in Reg 0x26 to 0x29.

### Over/Undervoltage Detection

There are two flags that can be used to detect undervoltage and overvoltage. These flags have a programmable voltage trip level. Refer to the Digital I/O section for all possible configurations.

Figure 6: ACS71020 Trim Diagram

## DIGITAL COMMUNICATION

### Communication Interfaces

The ACS71020 supports communication over 1 MHz I<sup>2</sup>C and 10 MHz SPI. However, the communication protocol is fixed during factory programming. Refer to the Selection Guide for more information.

### SPI

The SPI frame consists of:

- The Master writes on the MOSI line the 7-bit address of the register to be read from or written to.
- The next bit on the MOSI line is the read/write (RW) indicator. A high state indicates a Read and a low state indicates a Write.
- The device sends a 32-bit response on the MISO line. The contents correspond to the previous command.
- On the MOSI line, if the current command is a write, the 32 bits correspond to the Write data, and in the case of a read, the data is ignored.

### Registers and EEPROM

#### WRITE ACCESS

The ACS71020 supports factory and customer EEPROM space as well as volatile registers. The customer access code must be sent prior to writing these customer EEPROM spaces. In addition, the device includes a set of free space EEPROM registers that are accessible with or without writing the access code.

#### READ ACCESS

All EEPROM and volatile registers may be read at any time regardless of the access code.

#### EEPROM

At power up all shadow registers are loaded from EEPROM including all configuration parameters. The shadow registers can be written to in order to change the device behavior without having to perform an EEPROM write. Any changes made to shadow memory are volatile and do not persist through a reset event.

#### WRITING

The Timing Diagram for an EEPROM write is shown in Figure 7 and Figure 8.

Figure 7: EEPROM Write – SPI Mode

Figure 8: EEPROM Write – I<sup>2</sup>C Mode  
Blue represents data sent by the master and orange is the data sent by the slave.

ACS71020

Single Phase, Isolated, Power Monitoring IC  
with Voltage Zero Crossing and Overcurrent Detection

READING

The timing diagram for an EEPROM read is shown in Figure 9 and Figure 10.

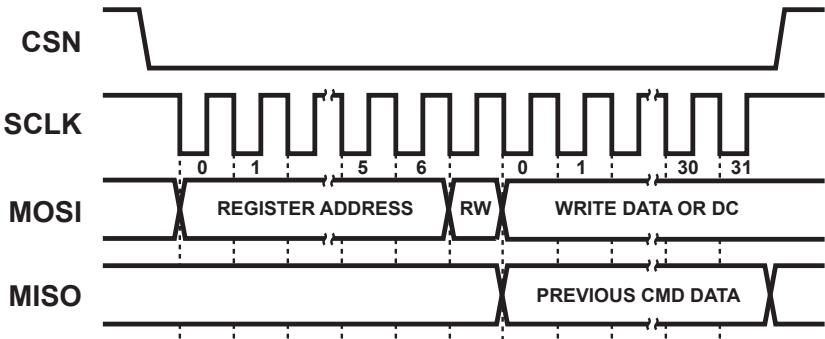

Figure 9: EEPROM Read – SPI Mode  
For SPI, the read data will be sent out during the above command.

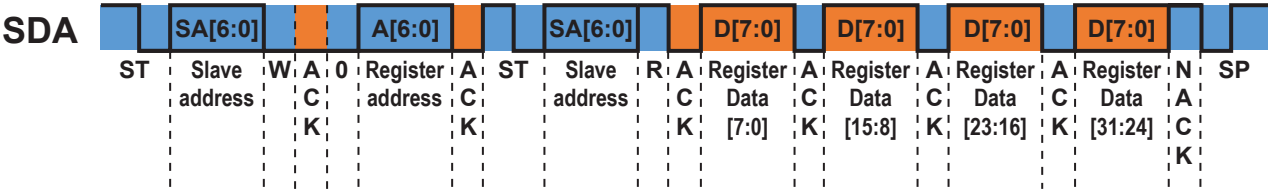

Figure 10: EEPROM Read – I²C Mode  
Blue represents data sent by the master and orange is the data sent by the slave.

**EEPROM Error Checking and Correction (ECC)**

Hamming code methodology is implemented for EEPROM checking and correction (ECC). ECC is enabled after power-up.

The ACS71020 analyzes message data sent by the controller and the ECC bits are added. The first 6 bits sent from the device to the controller are dedicated to ECC. The device always returns 32 bits.

**EEPROM ECC Errors**

Bits	Name	Description
31:28	–	No meaning
27:26	ECC	00 = No Error 01 = Error detected and message corrected 10 = Uncorrectable error 11 = No meaning
25:0	D[25:0]	EEPROM data

## Device Trim Flow

The trim process for voltage, current, and power channels are depicted in Figure 11 through Figure 13. Refer to the “Register Details” Section for more information regarding trim fields.

Figure 11: Voltage Channel Trim Flow

Figure 12: Current Channel Trim Flow

Figure 13: Power Channel Trim Flow

### Register Details – EEPROM

#### Register 0x0B/0x1B

Bits	Name	Description
8:0	qvo_fine	Offset fine trimming on current channel
17:9	sns_fine	Fine gain trimming on the current channel
20:18	crs_sns	Coarse gain setting
21	iavgselect	Current Averaging selection
25:22	unused	Unused
31:26	ecc	Error Code Correction

#### qvo\_fine

Offset adjustment for the current channel. This is a signed 9-bit number with an input range of –256 to 255. With a step size of 64 LSB, this equates to an offset trim range of –16384 to 16320 LSB, which is added to the icodes value. The trim is implemented as shown in Figure 12. The current channel’s offset trim should be applied before the gain is trimmed. “qvo\_fine” is further described in Table 1.

Table 1: qvo\_fine

Range	Value	Units
–256 to 255	–16,384 to 16,320	LSB

#### sns\_fine

Gain adjustment for the current channel. This is a signed 9-bit number with an input range of –256 to 255. This gain adjustment is implemented as a percentage multiplier centered around 1 (i.e. writing a 0 to this field multiplies the gain by 1, leaving the gain unaffected). The fine sensitivity parameter ranges from 50% to 150% of IP. The current channel’s offset trim should be applied before the gain is trimmed. “sns\_fine” is further described in Table 2.

Table 2: sns\_fine

Range	Value	Units
–256 to 255	50 to 100	%

#### crs\_sns

Coarse gain adjustment for the current channel. This gain is implemented in the analog domain before the ADC. This is a 3-bit number that allows for 8 gain selections. Adjustments to “crs\_sns” may impact the device’s performance over temperature. Datasheet limits apply only to the factory settings for “crs\_sns”. The gain settings map to 1×, 2×, 3×, 3.5×, 4×, 4.5×, 5.5×, and 8×. “crs\_sns” is further described in Table 3.

Table 3: crs\_sns

Range	Value	Units
0	1×	–
1	2×	–
2	3×	–
3	3.5×	–
4	4×	–
5	4.5×	–
6	5.5×	–
7	8×	–

#### iavgselect

Current Averaging selection enable. 0 will select vrms for averaging. 1 will select irms for averaging. See Figure 6.

### Register 0x0C/0x1C

Bits	Name	Description
6:0	rms_avg_1	Average of the rms voltage or current – stage 1
16:7	rms_avg_2	Average of the rms voltage or current – stage 2
25:17	n	Number of samples per half period.
31:26	ecc	Error Code Correction

#### rms\_avg\_1

Number of averages for the first averaging stage (vrmsavgonesec or irmsavgonesec). The value written into this field directly maps to the number of averages ranging from 0 to 127. The channel to be averaged is selected by the “current average select enable” bit (iavgselect). “rms\_avg\_1” is further described in Table 4.

Table 4: rms\_avg\_1

Range	Value	Units
0 to 127	0 to 127	number of averages

#### rms\_avg\_2

Number of averages for the second averaging stage (vrmsavgonemin or irmsavgonemin). This stage averages the outputs of the first averaging stage. The value written into this field directly maps to the number of averages ranging from 0 to 1023. The channel to be averaged is selected by the “current average select enable” bit (iavgselect). “rms\_avg\_2” is further described in Table 5.

Table 5: rms\_avg\_2

Range	Value	Units
0 to 1023	0 to 1023	number of averages

#### n

This is the number of samples to be used in all rms calculations if the “bypass n enable” bit (bypass\_n\_en) is set. If bypass\_n\_en is 0 (Reg 0x0E), then this field is unused. The value written into this field directly maps to the number of samples ranging from 0 to 511. “n” is further described in Table 6.

Table 6: n

Range	Value	Units
0 to 511	0 to 511	number of samples

## Register 0x0D/0x1D

Bits	Name	Description
6:0	pacc_trim	Trims the active power
7	ichan_del_en	Enable phase delay on voltage or current channel
8	unused	unused
11:9	chan_del_sel	Sets phase delay on voltage or current channel
12	unused	unused
20:13	fault	Sets the overcurrent fault threshold
23:21	fltldly	Sets the overcurrent fault delay
24	halfcycle_en	Outputs pulses at every zero crossing when enabled, and every rising edge when disabled
25	squarewave_en	Selects pulse or square wave output for the zero crossing reporting
31:26	ecc	Error Code Correction

### pacc\_trim

Offset trim in the active power calculation, and is implemented as shown in Figure 13. This is a signed 7-bit number with an input range of –64 to 63. This equates to a trim range of –384 to 378 LSB, which is added to the “pactive” value. “pacc\_trim” is further described in Table 7.

Table 7: pacc\_trim

Range	Value	Units
–64 to 63	–384 to 378	LSB

### ichan\_del\_en

Enables delay for either the voltage or current channel. Setting to 1 enables delay for the current channel. This behavior is depicted in Figure 11 and Figure 12. “ichan\_del\_en” is further described in Table 8.

Table 8: ichan\_del\_en

Range	Value	Units
0	0 – voltage channel	LSB
1	1 – current channel	LSB

### chan\_del\_sel

Sets the amount of delay applied to the voltage or current channel (set by ichan\_del\_en). The step size of this field is determined by the value of vadc\_rate\_sel. “chan\_del\_sel” is further described in Table 9.

Table 9: chan\_del\_sel

vadc_rate_sel	Range	Value	Units
0	0 to 7	0 to 219	μs
1	0 to 7	0 to 875	μs

### fault

Overcurrent fault threshold. This is an unsigned 8-bit number with an input range of 0 to 255, which equates to a fault range of 50% to 175% of IP. The factory setting of this field is 0. “fault” is further described in Table 10.

Table 10: fault

Range	Value	Units
0 to 255	50 to 175	% of IP

### fltldly

Fault delay setting of the amount of delay applied before flagging a fault condition. “fltldly” is further described in Table 11.

Table 11: fltldly

Range	Value	Units
0	0	μs
1	0	μs
2	4.75	μs
3	9.25	μs
4	13.75	μs
5	18.5	μs
6	23.25	μs
7	27.75	μs

### halfcycle\_en

Setting for the voltage zero-crossing detection. When set to 0, the voltage zero-crossing will be indicated on every rising edge. When set to 1, the voltage zero-crossing will be indicated on both rising and falling edges.

**squarewave\_en**

Setting for the Voltage Zero-Crossing Detection. When set to 0, the zero-crossing event will be indicated by a pulse on the DIO pin. When set to 1, the zero-crossing event will be indicated by a level change on the DIO pin. Note that the device must be configured to report Voltage-Zero-Crossing detection on the DIO pin.

### Register 0x0E/0x1E

Bits	Name	Description
5:0	vevent_cycs	Sets the number of qualifying cycles needed to flag overvoltage or undervoltage
6	vadc_rate_set	Sample Frequency Selection
7	bypass_n_en	When enabled, the dynamic calibration of n is ignored and instead uses the programmed n value for computations
13:8	overvreg	Sets the overvoltage fault threshold
19:14	undervreg	Sets the undervoltage fault threshold
20	delaycnt_sel	Sets the width of the voltage zero-crossing output pulse
25:21	unused	Unused
31:26	ecc	Error Code Correction

#### vevent\_cycs

Sets the number of cycles required to assert the OVRMS flag or the UVRMS. This is an unsigned 6-bit number with an input range of 0 to 63. The value in this field directly maps to the number of cycles. “vevent\_cycs” is further described in Table 12.

Table 12: vevent\_cycs

Range	Value	Units
0 to 63	1 to 64	cycles

#### vadc\_rate\_set

Sets the voltage ADC update rate. Setting this field to a 0 selects a 32 kHz update. Setting this field to a 1 selects an 8 kHz update, which will reduce the number of samples used in each rms calculation, but will allow for a larger phase delay correction between channels (see chan\_del\_sel). “vadc\_rate\_set” is further described in Table 13.

Table 13: vadc\_rate\_set

Range	Value	Units
0	32	kHz
1	8	kHz

#### bypass\_n\_en

When enabled, the dynamic calibration of n is ignored and instead uses the programmed n value for computations.

#### overvreg

Sets the threshold of the overvoltage rms flag (ovrms). This is a 6-bit number ranging from 0 to 63. This trip level spans the entire range of the vrms register. The flag is set if the rms value is above this threshold for the number of cycles selected in vevent\_cycs. “overvreg” is further described in Table 14.

Table 14: overvreg

Range	Value	Units
0 to 63	0 to 32,768	LSB

#### undervreg

Sets the threshold of the undervoltage rms flag (uvrms). This is a 6-bit number ranging from 0 to 63. This trip level spans one entire range of the vrms register. The flag is set if the rms value is below this threshold for the number of cycles selected in vevent\_cycs. “undervreg” is further described in Table 15.

Table 15: undervreg

Range	Value	Units
0 to 63	0 to 32,768	LSB

#### delaycnt\_sel

Selection bit for the width of pulse for a voltage zero-crossing event. When set to 0, the pulse is 32  $\mu$ s. When set to 1, the pulse is 256  $\mu$ s. When the squarewave\_en bit is set, this field is ignored. “delaycnt\_sel” is further described in Table 16.

Table 16: delaycnt\_sel

Range	Value	Units
0	32	$\mu$ s
1	256	$\mu$ s

### Register 0x0F/0x1F

Bits	Name	Description
1:0	unused	Unused
8:2	i2c_slv_addr	I <sup>2</sup> C slave address selection
9	i2c_dis_slv_addr	Disable I <sup>2</sup> C slave address selection circuit
15:10	unused	Unused
17:16	dio_0_sel	Digital output 0 multiplexor selection bits
19:18	dio_1_sel	Digital output 1 multiplexor selection bits
25:20	unused	Unused
31:26	ecc	Error Code Correction

#### i2c\_slv\_addr

Settings for the I<sup>2</sup>C Slave Address. The Voltage on the DIO pins are measured at power and are used to set the device's slave address.

Each DIO pin has 4 voltage “bins” which may be used to set the I<sup>2</sup>C slave address. These voltages may be set using resistor divider circuits from VCC to Ground. “i2c\_slv\_addr” is further described in Table 17.

Table 17: i2c\_slv\_addr

DIO_1	DIO_0	A6	A5	A4	A3	A2	A1	A0	Slave Address (decimal)
0	0	0	0	1	1	0	0	0	96
0	0	0	1	1	1	0	0	0	97
0	0	1	0	1	1	0	0	0	98
0	0	1	1	1	1	0	0	0	99
0	1	0	0	1	1	0	0	1	100
0	1	0	1	1	1	0	0	1	101
0	1	1	0	1	1	0	0	1	102
0	1	1	1	1	1	0	0	1	103
1	0	0	0	1	1	0	1	0	104
1	0	0	1	1	1	0	1	0	105
1	0	1	0	1	1	0	1	0	106
1	0	1	1	1	1	0	1	0	107
1	1	0	0	1	1	0	1	1	108
1	1	0	1	1	1	0	1	1	109
1	1	1	0	1	1	0	1	1	110
1	1	1	1	1	1	0	1	1	EE

#### i2c\_dis\_slv\_addr

Enables or disables the analog I<sup>2</sup>C slave address feature at power on. When this bit is set, the I<sup>2</sup>C slave address will map directly to i2c\_slv\_addr.

#### dio\_0\_sel

Determines which flags are output on the DIO0 pin. Only used when the device is in I<sup>2</sup>C programming mode. “dio\_0\_sel” is further described in Table 18.

Table 18: dio\_0\_sel

Value	Selection
0	VZC: Voltage zero crossing
1	OVRMS: The VRMS overvoltage flag
2	UVRMS: The VRMS undervoltage flag
3	The OR of OVRMS and UVRMS (if either flag is triggered, the DIO_0 pin will be asserted)

#### dio\_1\_sel

Determines which flags are output on the DIO1 pin. Only used when the device is in I<sup>2</sup>C programming mode. “dio\_1\_sel” is further described in Table 19.

Table 19: dio\_1\_sel

Value	Selection
0	OCF: Overcurrent fault
1	UVRMS: The VRMS undervoltage flag
2	OVRMS: The VRMS overvoltage flag
3	The OR of OVRMS, UVRMS, and OCF (if any of the three flags are triggered, the DIO_0 pin will be asserted).

### Register Details – Volatile

#### Register 0x20

Bits	Name	Description
14:0	vrms	Voltage RMS value
30:16	irms	Current RMS value

#### vrms

RMS voltage output. This field is an unsigned 15-bit fixed point number with 15 fractional bits. It ranges from 0 to ~1 with a step size of  $1/2^{15}$ . This number should be multiplied by the overall full scale of the voltage path in order to get to volts. For example, the device is trimmed to a full scale input of 275 mV, and if a resistor divider network is used to create 275 mV when it has 250 V across it, then the multiplier should be 250 V. “vrms” is further described in Table 20.

Table 20: vrms

Range	Value	Units
0 to ~1	$[0 \text{ to } \sim 1] \times \Delta V_{IN(MAX)}$	V

#### irms

RMS current output. This field is an unsigned 15-bit fixed point number with 14 fractional bits. It ranges from 0 to ~2 with a step size of  $1/2^{14}$ . This number should be multiplied by the overall full scale of the current path in order to get to amps. For example, if the device is trimmed to a full scale input of 30 A, then the multiplier should be 30 A. “irms” is further described in Table 21.

Table 21: irms

Range	Value	Units
0 to ~2	$[0 \text{ to } \sim 2] \times I_{PR(MAX)}$	A

#### Register 0x21

Bits	Name	Description
16:0	pactive	Active power

#### pactive

Active power output. This field is a signed 17-bit fixed point number with 15 fractional bits. It ranges from -2 to ~2 with a step size of  $1/2^{15}$ . This number should be multiplied by the overall full-scale power in order to get to watts. For example, if full-scale voltage is 250 V and  $I_{PR}$  is 30 A, the multiplier will be 7500 W. “pactive” is further described in Table 22.

Table 22: pactive

Range	Value	Units
-2 to ~2	$[-2 \text{ to } \sim 2] \times \text{MaxPow}$	W

**Register 0x22**

Bits	Name	Description
15:0	papparent	Apparent power

**papparent**

Apparent power output. This field is an unsigned 16-bit fixed point number with 15 fractional bits. It ranges from 0 to  $\sim 2$  with a step size of  $1/2^{15}$ . This number should be multiplied by the overall full-scale power in order to get to VA. For example, if full scale voltage is 250 V and  $I_{PR}$  is 30 A, then the multiplier will be 7500 VA. “papparent” is further described in Table 23.

**Table 23: papparent**

Range	Value	Units
0 to $\sim 2$	$[0 \text{ to } \sim 2] \times \text{MaxPow}$	VA

**Register 0x23**

Bits	Name	Description
16:0	pimag	Reactive power

**pimag**

Reactive power output. This field is an unsigned 17-bit fixed point number with 16 fractional bits. It ranges from 0 to  $\sim 2$  with a step size of  $1/2^{16}$ . This number should be multiplied by the overall full-scale power in order to get to VAR. For example, if full-scale voltage is 250 V and  $I_{PR}$  is 30 A, then the multiplier will be 7500 VAR. “pimag” is further described in Table 24.

**Table 24: pimag**

Range	Value	Units
0 to $\sim 2$	$[0 \text{ to } \sim 2] \times \text{MaxPow}$	VAR

**Register 0x24**

Bits	Name	Description
10:0	pfactor	Power factor

**pfactor**

Power factor output. This field is an unsigned 9-bit fixed point number with 9 fractional bits. It ranges from 0 to ~1 with a step size of  $1/2^9$ . “pfactor” is further described in Table 25.

**Table 25: pfactor**

Range	Value	Units
0 to ~1	0 to ~1	—

**Register 0x25**

Bits	Name	Description
8:0	numptsout	Number of samples of current and voltage used for calculations

**numptsout**

Number of points used in the rms calculation. If `bypass_n_en` is not set, then this will be the dynamic value that is evaluated internal to the device based on zero crossings of the voltage channel. If `bypass_n_en` is set to 1, then this will be the same as the value in the `n` field. “numptsout” is further described in Table 26.

**Table 26: numptsout**

Range	Value	Units
0 to 255	0 to 255	—

**Register 0x26**

Bits	Name	Description
14:0	vrmsavgonesec	Averaged voltage RMS value – duration set by rms_avg_1 – This register will be zero if iavgselect = 1
30:16	irmsavgonesec	Averaged current RMS value – duration set by rms_avg_1 – This register will be zero if iavgselect = 0

**vrmsavgonesec**

Voltage RMS value averaged according to rms\_avg\_1. This register will be zero if iavgselect = 1.

**irmsavgonesec**

Current RMS value averaged according to rms\_avg\_1. This register will be zero if iavgselect = 0.

**Register 0x27**

Bits	Name	Description
14:0	vrmsavgonemin	Averaged voltage RMS value – duration set by rms_avg_2 – This register will be zero if iavgselect = 1
30:16	irmsavgonemin	Averaged current RMS value – duration set by rms_avg_2 – This register will be zero if iavgselect = 0

**vrmsavgonemin**

Voltage RMS value averaged according to rms\_avg\_2. This register will be zero if iavgselect = 1.

**irmsavgonemin**

Current RMS value averaged according to rms\_avg\_2. This register will be zero if iavgselect = 0.

**Register 0x28**

Bits	Name	Description
16:0	pactavg	Active Power value averaged over up to one second — duration set by rms_avg_1

**pactavg**

Active power value averaged according to rms\_avg\_1.

**Register 0x29**

Bits	Name	Description
16:0	pactavgm	Active Power value averaged over up to one minute — duration set by rms_avg_2

**pactavgm**

Active power value averaged according to rms\_avg\_2.

**Register 0x2A**

Bits	Name	Description
16:0	vcodes	Instantaneous voltage measurement

**vcodes**

This field contains the instantaneous voltage measurement before any rms calculations are done. It is a 17-bit signed fixed point number with 16 fractional bits. It ranges from  $-1$  to  $\sim 1$  with a step size of  $1/2^{16}$ . This number should be multiplied by the overall full scale of the voltage path in order to get volts. For example, the device is trimmed to a full-scale input of 275 mV, and if a resistor divider network is used to create 275 mV, when it has 250 V across it, then the multiplier should be 250 V. “vcodes” is further described in Table 27.

**Table 27: vcodes**

Range	Value	Units
$-1$ to $\sim 1$	$[-1 \text{ to } \sim 1] \times \Delta V_{IN(MAX)}$	V

**Register 0x2B**

Bits	Name	Description
16:0	icodes	Instantaneous current measurement

**icodes**

This field contains the instantaneous current measurement before any rms calculations are done. This field is a signed 17-bit fixed point number with 15 fractional bits. It ranges from  $-2$  to  $\sim 2$  with a step size of  $1/2^{15}$ . This number should be multiplied by the overall full scale of the current path in order to get amps. For example, the device is trimmed to a full-scale input of 30 A, then the multiplier should be 30 A. “icodes” is further described in Table 28.

**Table 28: icodes**

Range	Value	Units
$-2$ to $\sim 2$	$[-2 \text{ to } \sim 2] \times I_{PR(MAX)}$	A

### Register 0x2C

Bits	Name	Description
31:0	pinstant	Instantaneous power – Multiplication of Vcodes and Icodes

#### pinstant

This field contains the instantaneous power measurement before any rms calculations are done. This field is a signed 32-bit fixed point number with 30 fractional bits. It ranges from  $-2$  to  $\sim 2$  with a step size of  $1/2^{30}$ . This number should be multiplied by the overall full-scale power in order to get to watts. For example, if full scale voltage is 250 V and  $I_{PR}$  is 30 A, then the multiplier will be 7500 W. “pinstant” is further described in Table 29.

Table 29: pinstant

Range	Value	Units
$-2$ to $\sim 2$	$[-2 \text{ to } \sim 2] \times \text{MaxPow}$	W

### Register 0x2D

Bits	Name	Description
0	vzerocrossout	Voltage zero-crossing output
1	faultout	Current fault output
2	faultlatched	Current fault output latched
3	overvoltage	Overvoltage flag
4	undervoltage	Undervoltage flag
5	posangle	Sign of the power angle
6	pospf	Sign of the power factor

#### vzerocrossout

Flag for the voltage zero-crossing events. Will be present and active regardless of DIO\_0\_Sel and DIO\_1\_Sel. This flag will still follow the halfcycle\_en and squarewave\_en settings.

#### faultout

Flag for the overcurrent events. Will be present and active regardless of DIO\_0\_Sel and DIO\_1\_Sel. Will only be set when fault is present.

#### faultlatched

Flag for the overcurrent events. This bit will latch and will remain 1 as soon as an overcurrent event is detected. This can be reset by writing a 1 to this field. Will be present and active regardless of DIO settings.

#### overvoltage

Flag for the overvoltage events. Will be present and active regardless of DIO\_0\_Sel and DIO\_1\_Sel. Will only be set when fault is present.

#### undervoltage

Flag for the undervoltage events. Will be present and active regardless of DIO\_0\_Sel and DIO\_1\_Sel. Will only be set when fault is present.

#### posangle

Sign bit to represent if the power is being generated (1) or consumed (0).

#### pospf

Bit to represent leading or lagging. A 0 represents the voltage leading and a 1 represents the voltage lagging.

# ACS71020

## *Single Phase, Isolated, Power Monitoring IC with Voltage Zero Crossing and Overcurrent Detection*

---

### Register 0x2F

Bits	Name	Description
31:0	access_code	Access code register: Customer code: 0x4F70656E

### Register 0x30

Bits	Name	Description
0	customer_access	Customer write access enabled. 0 = Non Customer mode. 1 = Customer mode.

### APPLICATION CONNECTIONS

The two figures below show possible circuit configurations that can be used with the voltage channel of this device.

In Figure 14, an isolated device ground is required for proper operation.

In Figure 15, an isolated device ground is not required but the

addition of R1 and R2 is required and they will create some offset on the measured signal. This offset will be ~1.4% of full scale on a 115 V system.

In both cases,  $R_{SENSE}$  should be sized such that the voltage across  $R_{SENSE}$  does not exceed the full-scale value of  $\Delta V_{IN(max)}$ .

Figure 14: Isolated Device Ground Required

Figure 15: Isolated Device Ground Not Required
